4

5 4Location-aware methods and systems are described. In one
6 embodiment, a portable computing device determines its location by
7 accessing one or more hierarchical tree structures each of which comprising
8 multiple nodes that represent physical or logical locations, and traversing at
9 least one node on the one or more hierarchical tree structures to ascertain
10 the location. The device then acquires digital data associated with the
11 determined location and that can permit the device to interact with a
12 location environment. The device then enables interaction with the location
13 environment based, at least in part, on the acquired digital data.
